The Sunday AI Workshop

Two hours, six modules, and two tracks: one for beginners and one for people already using AI. Hosted by Johnny Chan with Felix Lin, Xiao Zhang, and Andrew Eckstrom. Everything shown is free or nearly free, and every module ends with things you can do today.

1 AI Self-Defense for Private Practice PROTECT

The same qualities that make AI useful make it the best fraud tool ever built, and physicians are a high-value target. Voice clones that sound like family, vendor emails with new wiring instructions, your face selling supplements you have never heard of. Five free defenses you can set up today, starting with a family safe word.

2 Front Office Autopilot OPERATE

The paperwork that runs your office stops living in one employee's head. Build a real standard operating procedure (SOP) just by describing it, then, in the same chat, turn it into a laminated checklist, a new-hire training script, and a Spanish version. Plus the five-minute rewrite that turns any patient handout into one your patients will actually read and understand.

3 Vibe Coding Playground PLAY

Build your own one-page website and put it online. Then the life hacks: the unclaimed money sweep that checks every state you have ever lived in, the promo code hunt, and the one-page family site.

4 The Referral Engine GROW

Referrals follow relationships, and AI now lets you give every referring doctor a personal touch without spending hours on it. Personalized video thank-yous to your referring PCPs, warm specific notes drafted in minutes, and a monthly cadence for your top five referrers.

5 The Study Machine LEARN

Turn any new guideline, trial, or review into the format your brain actually absorbs. A private podcast for the commute, flashcards from any paper, a summary of only what changed since the last version, and a journal club one-pager. Use published papers only, never anything with patient information.

6 One Bot, One Job DELEGATE

A chatbot answers when you ask, whereas an agent does a job. You already manage human agents, like a medical assistant, a biller, a front desk. Describe an AI one in three parts: the job, what it produces, and when it stops and asks you. Then take anything you built today and put it on a schedule.

> No patient information goes into any AI chatbot. The only exception is a tool where your practice has signed a business associate agreement (BAA), the HIPAA contract that makes a vendor legally responsible for your patients' data. If you do not know whether you have one, you do not. Everything we show you needs zero patient data, which is exactly why we are showing it.
